

JavaScript Practical Tasks (String and Array Methods Only)

String Method Tasks

1. Find the length of a given string.
2. Convert a string to uppercase and lowercase.
3. Extract a part of a string using `slice()`.
4. Replace a specific word in a string using `replace()`.
5. Check whether a substring exists in a string using `includes()`.
6. Find the position of a substring using `indexOf()` and `lastIndexOf()`.
7. Remove extra spaces from both ends of a string using `trim()`.
8. Split a sentence into words using `split()`.
9. Concatenate two strings using `concat()`.

10. Retrieve a specific character from a string using `charAt()` and its Unicode using `charCodeAt()`.
-

Array Method Tasks

11. Create an array and find its length.
12. Add elements to the end and beginning of an array using `push()` and `unshift()`.
13. Remove elements from the end and beginning of an array using `pop()` and `shift()`.
14. Sort an array of strings alphabetically using `sort()`.
15. Reverse the order of elements in an array using `reverse()`.
16. Join all array elements into a single string using `join()`.
17. Find the index of a specific element in an array using `indexOf()`.
18. Check if an element exists in an array using `includes()`.

-
19. Extract a portion of an array using `slice()`.
 20. Replace or remove elements in an array using `splice()`.
